🚀 Event Registration Evolution: From Chaos to Clarity

This document captures the transformation of a fragmented registration process into a seamless, automated ecosystem. By refining the outputs from **Miro AI** and **Notion AI**, we've bridged the gap between "stopping errors" and "starting experiences."

💎 The Strategic Refinement

1. The "Smart-Validation" Requirement

Original: "The system shall prevent duplicate registrations by checking participant email addresses and ID numbers before allowing form submission, providing immediate feedback if a registration already exists."

✨ Refined for Scope:

"Intelligent Identity Recovery: To ensure 100% data integrity, the system shall cross-reference email and Student ID in real-time. Upon detecting a duplicate, the system will not simply block the user; it will provide a **'Magic Link'** to their **Personal Dashboard**, allowing them to view their status or modify their registration instantly."

- **The Difference:** We move from a "Hard Stop" to a "Helpful Pivot." Instead of just preventing an action, we empower the student to access their existing data.

---

2. The "Real-Time Truth" Process Step

Original: "Check email (uncertain status)."

✨ Refined for Clarity:

"Instant Status Transparency via Live Dashboard"

- **The Difference:** In the legacy "Google Form" flow, students are forced to wait for an email and remain in an "uncertain status." By refining this step, we emphasize the **Real-Time Status Dashboard** as the primary point of truth, eliminating the communication gaps and anxiety of "waiting to hear back."

📊 Legacy vs. Legend: The Upgrade Path

Feature	The "Google Form" Era	The Improved System
Validation	Manual deduplication	**Real-time auto-blocking**
User Status	Wait for email (Uncertain)	**Live Personal Dashboard**
Waitlists	No automated tracking	**Smart auto-promotion**

Feature	The "Google Form" Era	The Improved System
Check-in	Printed lists / Manual entry	**QR Code-based scanning**
